What's New In DB Browser For SQLite?

DB Browser for SQLite is a tool which simplifies the process of creating, modifying and managing SQLite database files. It provides all the features users need to access and query their data, including fields, tables, indexes and aggregate data, without having to use or understand complicated SQL commands. The software incorporates a set of wizards for database creation, modification and data querying. Moreover, it allows you to import and export data and SQL queries in text formats. DB Browser for SQLite also includes the functions of importing and exporting data and SQL queries. The software comes with a search tool which can easily assist you in quickly finding the desired entry in a large database. Additionally, the software features a go to function that makes navigation easier. The Import function allows you to import data from a text file, written in HTML, CSV, XML, as well as SQL formats, generated by the application itself. The Export function allows you to export data from the tables currently open in the software to files. The Import wizard only requires a select of the database file to open and the tables to query, with just a couple of clicks. After that, data can be selectively imported from any selected field by means of a checkbox (separated by commas), such as 'first name', 'last name', or 'age'. Import can also be automated through a conditional statement, which can be used to skip a group of fields (e.g. 'only import the user's Firstname, Lastname, and Age fields') or to take the entry with the minimum or maximum values (e.g. 'take the entry with the highest weight'). A similar wizard is included for the export of tables and fields. Through it, you can save the data selected in a table, filtering the result by a field. Data can be exported from the tables opened at the same time, or from a single table specified by you, or from the entire database. The export of the entire database can be performed by separating the database into several files in one of several delimiters (semi-colon, comma, blank, etc.). Import allows the insertion of new records for the fields of the selected table by simply typing data in the cells. You can, additionally, select the fields for which the data is to be stored. Moreover, the software allows for the modification of existing records through the use of cell content. The software also
